

**Devang Patel Institute of
Advance Technology and Research**
(A Constitute Institute of CHARUSAT)

Certificate

This is to certify that

Mr./Mrs. Savaliya Fenil R.

of CSE2 *Class,*

ID. No. 23DCS115 *has satisfactorily completed*

his/ her term work in Java Programming *for*

the ending in Nov 2024/2025

Date : 16/10/24

Amravat

Sign. of Faculty

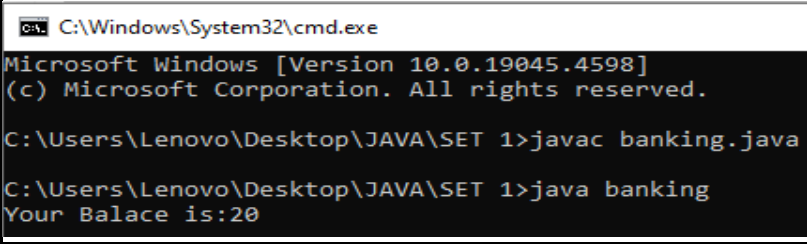

G

Head of Department

CHAROTAR UNIVERSITY OF SCIENCE & TECHNOLOGY**DEVANG PATEL INSTITUTE OF ADVANCE TECHNOLOGY & RESEARCH**

Department of Computer Science & Engineering

Subject Name: JAVA PROGRAMMING**Semester: 3****Subject Code: CSE201****Academic year: 2024-25****Part - 1**

No.	Aim of the Practical
2.	<p>Imagine you are developing a simple banking application where you need to display the current balance of a user account. For simplicity, let's say the current balance is \$20. Write a java program to store this balance in a variable and then display it to the user.</p> <p><u>PROGRAM CODE :</u></p> <pre>class banking { public static void main(String args[]){ int currentbalance=20; System.out.println("Your Balace is:" + currentbalance); } }</pre> <p><u>OUTPUT:</u></p>  <p><u>CONCLUSION:</u></p>

	From this practical I have learned about writing a basic Java program, including declaring a class, defining the main method, initializing variables, and printing output.
3.	<p>Write a program to take the user for a distance (in meters) and the time taken (as three numbers: hours, minutes, seconds), and display the speed, in meters per second, kilometers per hour and miles per hour (hint:1 mile = 1609 meters).</p> <p><u>PROGRAM CODE:</u></p> <pre>import java.util.Scanner; public class speed { public static void main(String args[]) { int h, M, s; int distance; Scanner S1 = new Scanner(System.in); System.out.println("Enter the distance travelled by user in meter:"); distance = S1.nextInt(); System.out.println("Enter the time in hours:"); h = S1.nextInt(); System.out.println("Enter the time in minutes:"); M = S1.nextInt(); System.out.println("Enter the time in seconds:"); s = S1.nextInt(); int totalSeconds = (h * 3600) + (M * 60) + s; if (totalSeconds > 0) { double Mpersec = (double) distance / totalSeconds;</pre>

```
double KmPerHr = Mpersec * 3.6;

double MilesPerHr = Mpersec * (3.6/1.609);

System.out.printf("The speed of the vehicle is %.2f m/s%n", Mpersec);
System.out.printf("The speed of the vehicle is %.2f km/hr%n", KmPerHr);
System.out.printf("The speed of the vehicle is %.2f miles/hr%n", MilesPerHr);}
else {
System.out.println("Invalid time. Time should be greater than 0.");
}
}
}
```

OUTPUT:

```
C:\Windows\System32\cmd.exe
Microsoft Windows [Version 10.0.19045.4598]
(c) Microsoft Corporation. All rights reserved.

C:\Users\Lenovo\Desktop\JAVA\SET 1>javac speed.java

C:\Users\Lenovo\Desktop\JAVA\SET 1>java speed
Enter the distance travelled by user in meter:
40000
Enter the time in hours:
1
Enter the time in minutes:
25
Enter the time in seconds:
12
The speed of the vehicle is 7.82 m/s
The speed of the vehicle is 28.17 km/hr
The speed of the vehicle is 17.51 miles/hr
```

CONCLUSION:

This Java program calculates the speed of a vehicle based on user-provided distance and time inputs. It ensures accuracy by validating time inputs and provides speed outputs in meters per second, kilometers per hour, and miles per hour, making it practical for real-world applications requiring precise speed measurements.

4. Imagine you are developing a budget tracking application. You need to calculate the total expenses for the month. Users will input their daily expenses, and the program should compute the sum of these expenses. Write a Java program to calculate the sum of elements in an array representing daily expenses.

PROGRAM CODE:

```
import java.util.Scanner;

public class Budget {
    public static void main(String[] args) {

        Scanner scanner = new Scanner(System.in);
        int NumDays;
        double totalExpenses = 0.0;

        System.out.println("Enter the number of days in the month: ");
        NumDays = scanner.nextInt();

        for (int i = 1; i <= NumDays; i++) {
            System.out.println("Enter expenses for day : $" + i);
            double dailyExpense = scanner.nextDouble();
            totalExpenses += dailyExpense;
        }
        scanner.close();
        System.out.printf("Total expenses for the month: $%.2f\n", totalExpenses);
    }
}
```

OUTPUT:

```

Microsoft Windows [Version 10.0.19045.4598]
(c) Microsoft Corporation. All rights reserved.

C:\Users\Lenovo\Desktop\JAVA\SET 1>javac Budget.java

C:\Users\Lenovo\Desktop\JAVA\SET 1>java Budget
Enter the number of days in the month:
4
Enter expenses for day : $1
95
Enter expenses for day : $2
45
Enter expenses for day : $3
32
Enter expenses for day : $4
65
Total expenses for the month: $237.00

```

Conclusion:

In this program, takes an array to input the daily expenses from the user and printing the sum of daily expenses.

5. An electric appliance shop assigns code 1 to motor, 2 to fan, 3 to tube and 4 for wires. All other items have code 5 or more. While selling the goods, a sales tax of 8% to motor, 12% to fan, 5% to tube light, 7.5% to wires and 3% for all other items is charged. A list containing the product code and price in two different arrays. Write a java program using switch statement to prepare the bill.

PROGRAM CODE:

```

import java.util.Scanner;
public class shop {
    public static void main(String args[]) {

        Scanner S1 = new Scanner(System.in);

        System.out.println("Enter the product code:");
        int productCode = S1.nextInt();

        System.out.println("Enter the price:");
        double price = S1.nextDouble();

        double tax = 0;
        switch (productCode) {

```

```
case 1:
tax = price * 0.08;
break;
case 2:
tax = price * 0.12;
break;
case 3:
tax = price * 0.05;
break;
case 4:
tax = price * 0.075;
break;
default:
tax = price * 0.03;
}

double totalPrice = price + tax;
System.out.println("Price: " + price);
System.out.println("Tax: " + tax);
System.out.println("Total Price: " + totalPrice);
}
}
```

OUTPUT:

 C:\Windows\System32\cmd.exe

```
C:\Users\Lenovo\Desktop\JAVA\SET 1>javac shop.java
```

```
C:\Users\Lenovo\Desktop\JAVA\SET 1>java shop
```

```
Enter the product code:
```

```
1
```

```
Enter the price:
```

```
500
```

```
Price: 500.0
```

```
Tax: 40.0
```

```
Total Price: 540.0
```

```
C:\Users\Lenovo\Desktop\JAVA\SET 1>java shop
```

```
Enter the product code:
```

```
2
```

```
Enter the price:
```

```
350
```

```
Price: 350.0
```

```
Tax: 42.0
```

```
Total Price: 392.0
```

```
C:\Users\Lenovo\Desktop\JAVA\SET 1>java shop
```

```
Enter the product code:
```

```
4
```

```
Enter the price:
```

```
920
```

```
Price: 920.0
```

```
Tax: 69.0
```

```
Total Price: 989.0
```

CONCLUSION:

Using a switch case in a Java program to handle different tax scenarios provides a structured and efficient way to calculate the final amount after adding taxes.

- 6 Create a Java program that prompts the user to enter the number of days (n) for which they want to generate their exercise routine. The program should then calculate and display the first n terms of the Fibonacci series, representing the exercise duration for each day.

PROGRAM CODE:

```
import java.util.Scanner;
```

```
class fibonacci
```

```
{
```

```
public static void main(String args[])
```

```
{
```

```
long sum = 0;
```

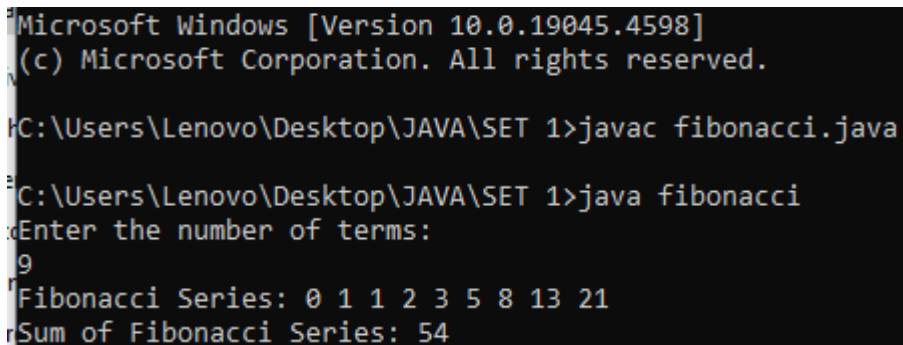

```
long c;
```

```
System.out.println("Enter the number of terms:");
```

```
Scanner S = new Scanner(System.in);
int n = S.nextInt();
long a = 0;
long b = 1;
System.out.print("Fibonacci Series: ");
for (int i = 1; i <= n; i++)
{
    System.out.print(a + " ");
    sum += a;
    c = a + b;
    a = b;
    b = c;
}
System.out.println("\nSum of Fibonacci Series: " + sum);
}
```

OUTPUT:

```
Microsoft Windows [Version 10.0.19045.4598]
(c) Microsoft Corporation. All rights reserved.

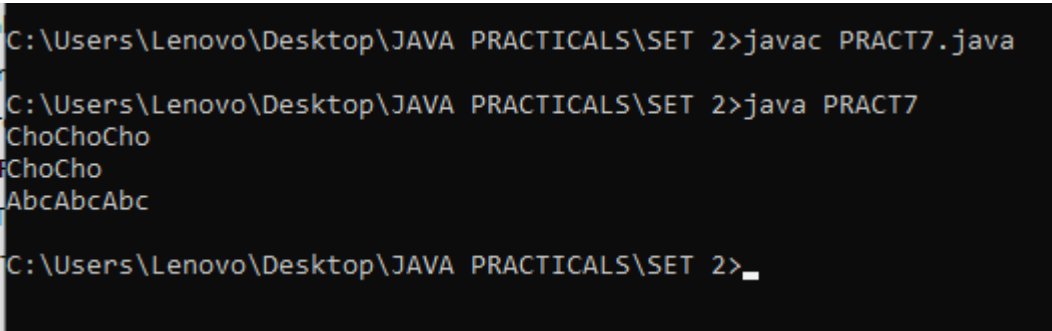

C:\Users\Lenovo\Desktop\JAVA\SET 1>javac fibonacci.java

C:\Users\Lenovo\Desktop\JAVA\SET 1>java fibonacci
Enter the number of terms:
9
Fibonacci Series: 0 1 1 2 3 5 8 13 21
Sum of Fibonacci Series: 54
```

CONCLUSION:

In this Java program, the concepts of the Fibonacci series and the sum of the series are implemented to demonstrate sequence generation and summation techniques. By computing the Fibonacci series, the program illustrates how each number is the sum of the two preceding ones, starting from 0 and 1.

Part - 2

No.	Aim of the Practical
7.	<p>Given a string and a non-negative int n, we'll say that the front of the string is the first 3 chars, or whatever is there if the string is less than length 3. Return n copies of the front; front_times('Chocolate', 2) → 'ChoCho' front_times('Chocolate', 3) → 'ChoChoCho' front_times('Abc', 3) → 'AbcAbcAbc'</p> <p><u>PROGRAM CODE:</u></p> <pre>public class PRACT7 { static int Choco(String s, int a) { String S1 = s.substring(0, 3); for (int i = 0; i < a; i++) { System.out.print(S1); } System.out.println(); return 0; } public static void main(String args[]) { Choco("Chocolate", 3); Choco("Chocolate", 2); Choco("Abc", 3); } }</pre> <p><u>OUTPUT:</u></p>  <pre>C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>javac PRACT7.java C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>java PRACT7 ChoChoCho ChoCho AbcAbcAbc C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>_</pre> <p><u>CONCLUSION:</u></p> <p>In this Java Program we have used the concept of substring and repeating that string for n times.</p>

8. Given an array of ints, return the number of 9's in the array. array_count9([1, 2, 9]) → 1
array_count9([1, 9, 9]) → 2 array_count9([1, 9, 9, 3, 9]) → 3

PROGRAM CODE :

```
public class PRACT8{

    public static void main(String args[]) {

        int[] arr1 = { 1, 2, 9 };

        int[] arr2 = { 1, 9, 9 };

        int[] arr3 = { 1, 9, 9, 3, 9 };

        System.out.println(arrayCount9(arr1));

        System.out.println(arrayCount9(arr2));

        System.out.println(arrayCount9(arr3));

    }

    public static int arrayCount9(int[] a) {

        int count = 0;

        for (int num = 0; num < a.length; num++) {

            if (a[num] == 9) {

                count++;

            }

        }

    }

}
```

```
}  
  
return count;  
  
}  
  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>javac PRACT8.java  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>java PRACT8  
1  
2  
3
```

CONCLUSION:

In this Java Program we have applied the logic for counting the no. of two's that we have entered in the string.

double_char('The') → 'TThhee' double_char('AAbb') → 'AAAAbbbb' double_char('Hi-There') → 'HHii--TThheerree'

PROGRAM CODE:

```
public class PRACT9 {

    public static void main(String[] args) {
        System.out.println(doubleChar("The"));
        System.out.println(doubleChar("AAbb"));
        System.out.println(doubleChar("Hi-There"));
    }

    public static String doubleChar(String str) {
        String doubledStr = ""; // Initialize an empty string to store the result

        for (int i = 0; i < str.length(); i++) {
            char c = str.charAt(i); // Get the current character

            doubledStr += c + "" + c;
        }

        return doubledStr;
    }
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>javac PRACT9.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>java PRACT9
TThhee
AAAAbbbb
HHii--TThheerree
```

CONCLUSION:

In this java program we have applied logic to double every character of the string and print it.

10

Perform following functionalities of the string:

- Find Length of the String

- Lowercase of the String
- Uppercase of the String
- Reverse String

PROGRAM CODE:

```
public class PRACT10
{
    public static void main(String args[])
    {

        String S1 = "Charusat";
        System.out.println(S1.toLowerCase());

        String S2 = "charusat";
        System.out.println(S2.toUpperCase());

        String S3 = "HelloWorld!";
        System.out.println(S3.length());

        String S4 = "Bhalodia Veer";
        System.out.println(new StringBuilder(S4).reverse().toString());

    }
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>javac PRACT10.java
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>java PRACT10
charusat
CHARUSAT
11
reeV aidolahB
```

CONCLUSION:

In this java program we have applied logic to find the length of the string , convert the string to lowercase , convert to uppercase , and reverse the entered string.

11

Perform following Functionalities of the string: "CHARUSAT UNIVERSITY"

- Find length
- Replace 'H' by 'FIRST LATTER OF YOUR NAME'
- Convert all character in lowercase

PROGRAM CODE:

```
public class PRACT11
{
    public static void main(String[] args) {

        String Str="CHARUSAT UNIVERSITY";
        System.out.println("To Lower case:" + Str.toLowerCase());

        System.out.println("Length of String:" + Str.length());

        System.out.println("After H is replaced:" + Str.replace('H', 'V'));
    }
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>javac PRACT11.java
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 2>java PRACT11
To Lower case:charusat university
Length of String:19
After H is replaced:CVARUSAT UNIVERSITY
```

CONCLUSION:

In this java program we have applied the logic to replace the character of the entered string to some other character .

No.	Aim of the Practical
12.	<p>Imagine you are developing a currency conversion tool for a travel agency. This tool should be able to convert an amount in Pounds to Rupees. For simplicity, we assume the conversion rate is fixed: 1 Pound = 100 Rupees. The tool should be able to take input both from command-line arguments and interactively from the user.</p> <p><u>PROGRAM CODE :</u></p> <pre>import java.util.*; class PRACT12 { public static void main(String[] args) { int a= Integer.parseInt(args[0]); int c=a*100; System.out.println("Currency in a rupees=" + c); Scanner S1 = new Scanner(System.in); int R=S1.nextInt(); int P=R*100; System.out.println("Currency in Rupees=" + P); } }</pre> <p><u>OUTPUT:</u></p>  <pre>Microsoft Windows [Version 10.0.19045.4717] (c) Microsoft Corporation. All rights reserved. C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3>javac PRACT12.java C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3>java PRACT12 15 Currency in a rupees=1500 23 Currency in Rupees=2300</pre> <p><u>CONCLUSION:</u></p> <p>It converts a given amount to a different currency unit by multiplying it with a fixed</p>

	conversion rate (100). The program utilizes command-line arguments for initial input and the Scanner class for runtime input from the user.
13.	<p>Create a class called Employee that includes three pieces of information as instance variables—a first name (type String), a last name (type String) and a monthly salary (double). Your class should have a constructor that initializes the three instance variables. Provide a set and a get method for each instance variable. If the monthly salary is not positive, set it to 0.0. Write a test application named EmployeeTest that demonstrates class Employee's capabilities. Create two Employee objects and display each object's yearly salary. Then give each Employee a 10% raise and display each Employee's yearly salary</p> <p><u>PROGRAM CODE :</u></p> <pre>import java.util.Scanner; class Employee { private String fn; private String ln; private double salary; Scanner s = new Scanner(System.in); Employee() { } Employee(String fn, String ln, double salary) { this.fn = fn; this.ln = ln; this.salary = salary;</pre>

```
}

public void setfn() {

System.out.print("Enter employee first name :");

fn = s.next();

}

public void setln() {a

System.out.print("Enter employee last name :");

ln = s.next();

}

public void setsalary() {

System.out.print("Enter employee salary :");

salary = s.nextDouble();

if(salary<0){

salary=0;

}

else{

salary=(salary*12)+(salary*12)*0.1;

}}

public String getfn() {

return fn;
```

```
}

public String getln() {
    return ln;
}

public double getsalary() {
    return salary;
}}

public class PRACT13 {
    public static void main(String[] args) {

        Employee e1=new Employee();
        Employee e2=new Employee();

        e1.setfn();
        e1.setln();
        e1.setsalary();

        e2.setfn();
        e2.setln();
        e2.setsalary();

        System.out.print(e1.getfn()+" ");

        System.out.println(e1.getln());

        System.out.println(e1.getsalary());
```

```
System.out.print(e2.getfn()+" ");  
  
System.out.println(e2.getln());  
  
System.out.println(e2.getsalary());  
  
}  
  
}
```

OUTPUT:

A screenshot of a Windows command prompt showing the compilation and execution of a Java program. The commands are: `C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3>javac PRACT13.java` and `C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3>java PRACT13`. The output shows two employees being added: Veer Bhalodia with salary 5000 and Yash Khanpara with salary 6000. The final output is: `Veer Bhalodia`, `66000.0`, `Yash Khanpara`, `79200.0`.

CONCLUSION:

This `Employee` class in Java demonstrates encapsulation by using private fields for first name, last name, and salary, with a constructor for initialization and public methods for controlled access and modification, ensuring data hiding and integrity.

14

Create a class called Date that includes three pieces of information as instance variables—a month (type int), a day (type int) and a year (type int). Your class should have a constructor that initializes the three instance variables and assumes that the values provided are correct. Provide a set and a get method for each instance variable. Provide a method displayDate that

displays the month, day and year separated by forward slashes (/). Write a test application named DateTest that demonstrates class Date's capabilities.

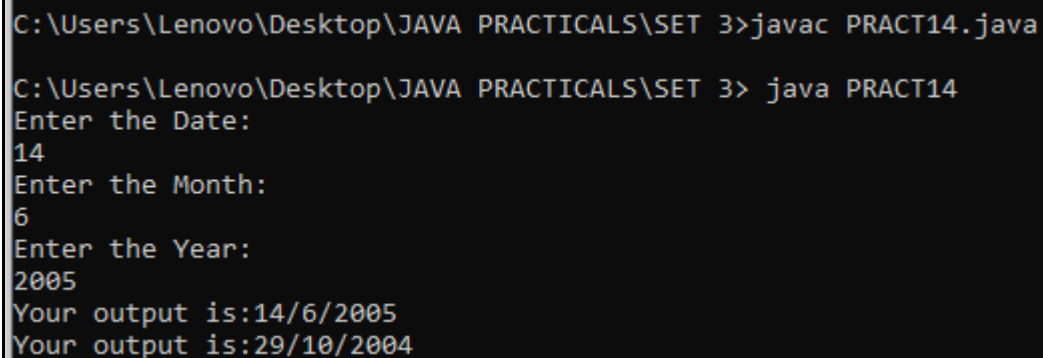

PROGRAM CODE :

```
import java.util.Scanner;
class Date
{
    int year;
    int month;
    int day;
    Scanner S1 = new Scanner(System.in);

    void getDate()
    {
        System.out.println("Enter the Date:");

        day=S1.nextInt();
    }
    void getMonth()
    {
        System.out.println("Enter the Month:");
        month=S1.nextInt();
    }
    void getYear()
    {
        System.out.println("Enter the Year:");
        year=S1.nextInt();
    }
    void displayDate()
    {
        System.out.println( "Your output is:" + day+"/"+month+"/"+year);
    }
    Date(int d,int m ,int y)
    {
        day=d;
        month=m;
        year=y;
    }
    Date()
}
```

```
{  
}  
}  
class PRACT14  
{  
public static void main(String[] args)  
{  
  
Date d2 = new Date(29,10,2004);  
Date d1 = new Date(0,0,0);  
d1.getDate();  
d1.getMonth();  
d1.getYear();  
d1.displayDate();  
d2.displayDate();  
}  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3>javac PRACT14.java  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3> java PRACT14  
Enter the Date:  
14  
Enter the Month:  
6  
Enter the Year:  
2005  
Your output is:14/6/2005  
Your output is:29/10/2004
```

CONCLUSION:

This Java program demonstrates OOP fundamentals by defining a Date class with a constructor for initialization and a method to display the date. The main method creates an instance of Date and calls displayDate.

- 15 Write a program to print the area of a rectangle by creating a class named 'Area' taking the values of its length and breadth as parameters of its constructor and having a method named 'returnArea' which returns the area of the rectangle. Length and breadth of rectangle are entered through keyboard.

PROGRAM CODE :

```
import java.util.Scanner;
class Area {
double length;
double breadth;

Area(double l, double b) {
length = l;
breadth = b;
}
double returnArea() {
return length * breadth;
}
}
class PRACT15 {
public static void main(String[] args)
{
Scanner scanner = new Scanner(System.in);
System.out.println("Enter length:");
double length = scanner.nextDouble();
System.out.println("Enter breadth:");
double breadth = scanner.nextDouble();
Area A = new Area(length, breadth);
System.out.println(A.returnArea());

}
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3>javac PRACT15.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3> java PRACT15
Enter length:
9
Enter breadth:
8
72.0
```

CONCLUSION:

It includes user input handling with the Scanner class to dynamically receive length and breadth values. An Area class instance is created with these values, and its method returnArea() calculates and returns the area of a rectangle.

- 16** Print the sum, difference and product of two complex numbers by creating a class named 'Complex' with separate methods for each operation whose real and imaginary parts are entered by user.

PROGRAM CODE :

```
import java.util.Scanner;

class complex {

    int r, i;
    int sumi, sumr;
    Scanner s = new Scanner(System.in);

    void setr() {
        System.out.print("enter real number :");
        r = s.nextInt();
    }

    void seti() {
        System.out.print("enter imaginary number :");
        i = s.nextInt();
    }

    void sum(complex c) {
        sumi = i + c.i;
```

```
sumr = r + c.r;
System.out.println(sumr + "+" + sumi + "i");
}

void difrence(complex c) {
int difi = i - c.i;
int difr = r - c.r;
if (difi >= 0) {
System.out.println(difr + "+" + difi + "i");
} else {
System.out.println(difr + "" + difi + "i");
}
}

void product(complex c){

int pror=(r*c.r)-(i*c.i);
int proi=(r*c.i)+(i*c.r);
if(proi>=0)
System.out.println(pror+" "+proi+"i");
else
System.out.println(pror+""+proi+"i");
}

}

public class PRACT16 {

public static void main(String[] args) {
complex c1 = new complex();
complex c2 = new complex();
c1.setr();
c1.seti();
c2.setr();
c2.seti();
c1.sum(c2);
c1.difrence(c2);
c1.product(c2);
}
}
```

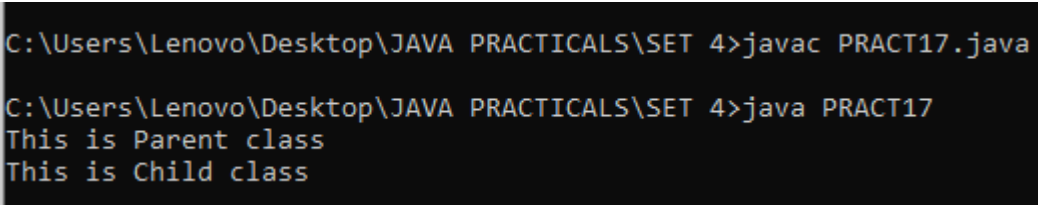

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3>javac PRACT16.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 3>java PRACT16
enter real number :4
enter imaginary number :5
enter real number :9
enter imaginary number :2
13+7i
-5+3i
26+53i
```

CONCLUSION:

This Java program defines a `complex` class to handle complex numbers, including methods for setting real and imaginary parts and summing two complex numbers. The main method creates two `complex` objects, sets their values, and sums them, demonstrating basic OOP principles.

No.	Aim of the Practical
17.	<p>Create a class with a method that prints "This is parent class" and its subclass with another method that prints "This is child class". Now, create an object for each of the class and call 1 - method of parent class by object of parent.</p> <p><u>PROGRAM CODE :</u></p> <pre> class Parent{ void printparent(){ System.out.println("This is Parent class"); } } class Child extends Parent{ void printchild(){ System.out.println("This is Child class"); } } public class PRACT17{ public static void main(String[] args) { Parent parent = new Parent(); parent.printparent(); Child child = new Child(); child.printchild(); } } </pre> <p><u>OUTPUT:</u></p>  <pre> C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>javac PRACT17.java C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>java PRACT17 This is Parent class This is Child class </pre> <p><u>CONCLUSION:</u></p> <p>In this java code we have applied a concept of single inheritance.</p>

18. Create a class named 'Member' having the following members: Data members
1 - Name
2 - Age
3 - Phone number
4 - Address
5 - Salary
It also has a method named 'printSalary' which prints the salary of the members. Two classes 'Employee' and 'Manager' inherits the 'Member' class. The 'Employee' and 'Manager' classes have data members 'specialization' and 'department' respectively. Now, assign name, age, phone number, address and salary to an employee and a manager by making an object of both of these classes and print the same.

PROGRAM CODE:

```
import java.util.Scanner;

class Employee {

    private String fn;
    private String ln;
    private double salary;
    Scanner s = new Scanner(System.in);

    Employee() {
    }

    public void setfn() {
        System.out.print("Enter employee first name :");
        fn = s.next();
    }

    public void setln() {
        System.out.print("Enter employee last name :");
        ln = s.next();
    }

    public void setsalary() {
        System.out.print("Enter employee salary :");
        salary = s.nextDouble();
    }
}
```

```
        if(salary<0){
            salary=0;
        }
        else{
            salary=(salary*12)+(salary*12)*0.1;
        }

    }

    public String getfn() {
        return fn;
    }

    public String getln() {
        return ln;
    }

    public double getsalary() {
        return salary;
    }

}

public class PRACT18 {

    public static void main(String[] args) {
        Employee e1=new Employee();
        Employee e2=new Employee();
        e1.setfn();
        e1.setln();
        e1.setsalary();
        e2.setfn();
        e2.setln();
        e2.setsalary();

        System.out.print(e1.getfn()+" ");
        System.out.println(e1.getln());
        System.out.println(e1.getsalary());

        System.out.print(e2.getfn()+" ");
```

```
System.out.println(e2.getln());  
System.out.println(e2.getsalary());  
  
}  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>javac PRACT18.java  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>java PRACT18  
Enter employee first name :Veer  
Enter employee last name :Bhalodia  
Enter employee salary :50000  
Enter employee first name :Yash  
Enter employee last name :Khanpara  
Enter employee salary :60000  
Veer Bhalodia  
660000.0  
Yash Khanpara  
792000.0
```

CONCLUSION:

In this java code we have implemented a concept of inheritance to take input from the user About the details of employee and manager and displaying all information.

19. Create a class named 'Rectangle' with two data members 'length' and 'breadth' and two methods to print the area and perimeter of the rectangle respectively. Its constructor having parameters for length and breadth is used to initialize length and breadth of the rectangle. Let class 'Square' inherit the 'Rectangle' class with its constructor having a parameter for its side (suppose s) calling the constructor of its parent class as 'super(s,s)'. Print the area and perimeter of a rectangle and a square. Also use array of objects.

PROGRAM CODE:

```
class rectangle{
int length;
int breadth;

rectangle(int length , int breadth){
this.length = length;
this.breadth = breadth;
}
void rec_peri(){
System.out.println("Rec - perimeter : " + 2*(length+breadth));
}
void rec_area(){
System.out.println("Rec - Area " + length*breadth);
}
}

class square extends rectangle{
int side;

square(int side){
super(side,side);
this.side = side;
}
void sq_peri(){
System.out.println("Square perimeter : " + 4*side);
}

void sq_area(){
System.out.println("Square Area : " + side*side);
}
```

```
}  
  
public class PRACT19 {  
    public static void main(String[] args) {  
        square s = new square(10);  
        s.rec_area();  
        s.rec_peri();  
        s.sq_area();  
        s.sq_peri();  
    }  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>javac PRACT19.java  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>java PRACT19  
Rec - Area 100  
Rec - perimeter : 40  
Squarev Area : 100  
Square perimeter : 40
```

Conclusion:

This code calculate the area and perimeter of square and rectangle by the concept of inheritance where the class square inherits the methods of its parent class rectangle.

20.

Create a class named 'Shape' with a method to print "This is This is shape". Then create two other classes named 'Rectangle', 'Circle' inheriting the Shape class, both having a method to print "This is rectangular shape" and "This is circular shape" respectively. Create a subclass 'Square' of 'Rectangle' having a method to print "Square is a rectangle". Now call the method of 'Shape' and 'Rectangle' class by the object of 'Square' class.

```
class Shape {
```

PROGRAM CODE:

```
Shape() {
```

```
System.out.println("This is shape class");
```

```
}
```

```
}
```

```
class Rectangle extends Shape {
```

```
void rectangle() {
```

```
System.out.println("This is rectangular shape");
```

```
}
```

```
}
```

```
class Circle extends Shape {
```

```
void circle() {
```

```
System.out.println("This is circular shape");
```

```
}
```

```
}
```

```
class Square extends Rectangle {
```

```
void square() {
```

```
System.out.println("Square is a rectangle");
```

```
}
```

```
}
```

```
public class PRACT20 {
```

```
public static void main(String[] args) {
```

```
Square sq = new Square();
```

```
sq.rectangle();  
sq.square();  
}  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>javac PRACT20.java  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>java PRACT20  
This is shape class  
This is rectangular shape  
Square is a rectangle
```

CONCLUSION:

In the main() method, an object of the static nested class square is created, and it prints "Square is a Rectangle", "This is Shape", and "This is Rectangle Shape" using inherited and local methods. These calls demonstrate multi-level inheritance and method overriding.

- | | |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 21. | Create a class 'Degree' having a method 'getDegree' that prints "I got a degree". It has two subclasses namely 'Undergraduate' and 'Postgraduate' each having a method with the same |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

name that prints "I am an Undergraduate" and "I am a Postgraduate" respectively. Call the method by creating an object of each of the three classes.

PROGRAM CODE:

```
class Degree {
void getDegree() {
System.out.println("I got a degree");
}
}

class Undergraduate extends Degree {
void getDegree() {
System.out.println("I am an Undergraduate");
}
}

class Postgraduate extends Degree {
void getDegree() {
System.out.println("I am a Postgraduate");
}
}

public class PRACT21 {
public static void main(String[] args) {
Degree degree = new Degree();
Undergraduate undergraduate = new Undergraduate();
Postgraduate postgraduate = new Postgraduate();

degree.getDegree();
undergraduate.getDegree();
postgraduate.getDegree();
}
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>javac PRACT21.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>java PRACT21
I got a degree
I am an Undergraduate
I am a Postgraduate
```

CONCLUSION:

The main() method creates objects of degree, undergraduate, and postgraduate, each calling their respective getDegree() methods, printing "I got a Degree", "I am an Undergraduate", and "I am a Postgraduate". This demonstrates method overriding in inheritance.

22. Write a java that implements an interface AdvancedArithmetic which contains a method signature int divisor_sum(int n). You need to write a class called MyCalculator which implements the interface. divisorSum function just takes an integer as input and return the sum of all its divisors. For example, divisors of 6 are 1, 2, 3 and 6, so divisor_sum should return 12. The value of n will be at most 1000.

PROGRAM CODE:

```
import java.util.*;

interface AdvancedArithmetic{
    public int divisor_sum(int n);
}

class MyCalculator implements AdvancedArithmetic{
    // @Override
    public int divisor_sum(int n) {
        int sum = 0;
        for(int i=1 ; i<=n ; i++){
            if(n%i==0){
                sum += i;
            }
        }
        return sum;
    }
}
```

```

}

public class PRACT22 {
public static void main(String[] args) {
Scanner s = new Scanner(System.in);
MyCalculator m = new MyCalculator();
System.out.print("Enter Number : ");
int n = s.nextInt();
System.out.println("Sum of the Divisors of " + n + " is " + m.divisor_sum(n));
s.close();
}
}

```

OUTPUT:

```

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>java PRACT22
Enter Number : 28
Sum of the Divisors of 28 is 56

```

CONCLUSION:

The code implements the AdvancedArithmetic interface, with MyCalculator calculating the sum of divisors of a number. In the main() method, the user inputs a number, and the program prints the sum of its divisors.

23. Assume you want to capture shapes, which can be either circles (with a radius and a color) or rectangles (with a length, width, and color). You also want to be able to create signs (to post in the campus center, for example), each of which has a shape (for the background of the sign) and the text (a String) to put on the sign. Create classes and interfaces for circles, rectangles, shapes, and signs. Write a program that illustrates the significance of interface default method.

PROGRAM CODE:

```

interface Shape{
void print();
}

```

```
class Circle implements Shape{
    int radius;
    String color;
    Circle(int radius, String color){
        this.radius = radius;
        this.color = color;
    }
    public void print(){
        System.out.println("Radius : "+radius+" Color : "+color);
    }
}

class Rectangle implements Shape{
    int length;
    int width;
    String color;
    Rectangle(int length, int width, String color){
        this.length = length;
        this.width = width;
        this.color = color;
    }
    public void print(){
        System.out.println("Length : "+length+" Width : "+width+" Color : "+color);
    }
}

class Sign{
    Shape s;
    String text;
    Sign(Shape s, String text){
        this.s = s;
        this.text = text;
    }
    void print(){
        s.print();
        System.out.println("Text : "+text);
    }
}
```

```

public class PRACT23 {
    public static void main(String[] args) {
        Circle c = new Circle(10, "Red");
        Rectangle r = new Rectangle(10, 20, "Blue");
        Sign s = new Sign(c, "Circle Sign");
        s.print();
        Sign s1 = new Sign(r, "Rectangle Sign");
        s1.print();
    }
}

```

OUTPUT:

```

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>javac PRACT23.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 4>java PRACT23
Radius : 10 Color : Red
Text : Circle Sign
Length : 10 Width : 20 Color : Blue
Text : Rectangle Sign

```

CONCLUSION:

The code defines an interface Shape with a default and an abstract method, and two classes Circle and Rectangle implement it. The Sign class associates a shape with text, and in the main() method, it prints the details of both a circle and a rectangle along with their corresponding signs.

Part - 5

No.	Aim of the Practical
24.	<p>Write a java program which takes two integers x & y as input, you have to compute x/y. If x and y are not integers or if y is zero, exception will occur and you have to report it.</p> <p><u>PROGRAM CODE :</u></p> <pre>import java.util.*;</pre>

```
public class PRACT24 {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
        try {  
            System.out.print("Enter the value of x: ");  
            int x = scanner.nextInt();  
            System.out.print("Enter the value of y: ");  
            int y = scanner.nextInt();  
            int result = x / y;  
            System.out.println("Result: " + result);  
        } catch (InputMismatchException e) {  
            System.out.println("Error: Please enter valid  
integers.");  
        } catch (ArithmeticException e) {  
            System.out.println("Error: Division by zero is not allowed");  
        }  
        scanner.close();  
    }  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 5>javac PRACT24.java  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 5>java PRACT24  
Enter the value of x: 5  
Enter the value of y: 0  
Error: Division by zero is not allowed.  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 5>java PRACT24  
Enter the value of x: SD  
Error: Please enter valid integers.
```

CONCLUSION:

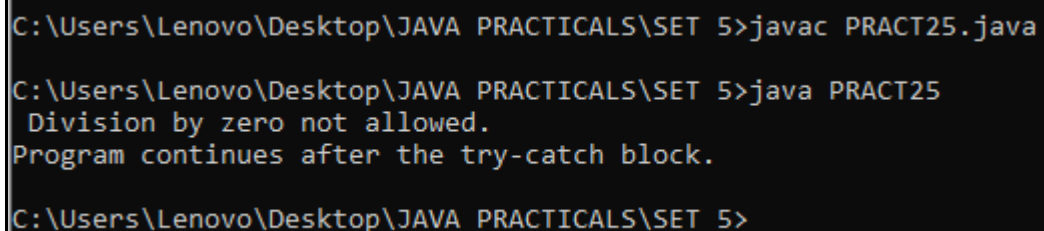

This Java program takes two integer inputs from the user and performs division, handling exceptions for invalid input and division by zero. It ensures the program doesn't crash by providing appropriate error messages for these cases.

25

Write a Java program that throws an exception and catch it using a try-catch block.

PROGRAM CODE:

```
public class PRACT25 {  
  
    public static void main(String[] args) {  
        try {  
  
            int number = 10;  
            int result = number / 0;  
            System.out.println("The result is: " + result);  
        } catch (ArithmeticException e) {  
  
            System.out.println(" Division by zero not allowed.");  
        }  
  
        System.out.println("Program continues after the try-catch block.");  
    }  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 5>javac PRACT25.java  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 5>java PRACT25  
    Division by zero not allowed.  
Program continues after the try-catch block.  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 5>
```

CONCLUSION:

This enhanced code includes comments, an additional finally block for code that should always be executed, and more descriptive error messages

26. Write a java program to generate user defined exception using “throw” and “throws” keyword. Also Write a java that differentiates checked and unchecked exceptions. (Mention at least two checked and two unchecked exceptions in program).

PROGRAM CODE:

```
class AgeException extends Exception {
public AgeException(String message) {
super(message);
}
}

public class UserDefinedException {

static void checkAge(int age) throws AgeException {
if (age < 18) {
throw new AgeException("Age is less than 18. Access denied.");
} else {
System.out.println("Access granted.");
}
}

public static void main(String[] args) {
try {
checkAge(16);
} catch (AgeException e) {
```

```

System.out.println("Caught Exception: " + e.getMessage());
}

try {
    checkAge(20);
} catch (AgeException e) {
    System.out.println("Caught Exception: " + e.getMessage());
}
}
}

```

OUTPUT:

```

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 5>javac PRACT26.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 5>java PRACT26
Caught Exception: Age is less than 18. Access denied.
Access granted.

```

Conclusion:

The provided code demonstrates how to create and handle a custom exception in Java using the AgeException class. The checkAge method verifies whether a user is eligible for access based on their age. If the age is less than 18, it throws the AgeException with a custom error message. This exception is caught in the main method, where an appropriate message is printed. By utilizing the throw and throws keywords, the program effectively manages error conditions (age restrictions).

Part - 6

No.	Aim of the Practical
-----	----------------------

27. Write a program that will count the number of lines in each file that is specified on the command line. Assume that the files are text files. Note that multiple files can be specified, as in "java Line Counts file1.txt file2.txt file3.txt". Write each file name, along with the number of lines in that file, to standard output. If an error occurs while trying to read from one of the files, you should print an error message for that file, but you should still process all the remaining files.

PROGRAM CODE:

```
import java.io.BufferedReader;
import java.io.FileReader;
import java.io.IOException;

public class PRACT27 {
    public static void main(String[] args) throws IOException{
        for(String s : args) {
            FileReader f = new FileReader(s);
            BufferedReader file = new BufferedReader(f);
            int count = 0;
            while(file.readLine() != null)
                count++;
            System.out.println("Lines in " + s + " : " + count);
            file.close();
        }
    }
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\1.COUNT LINES>javac PRACT27.java  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\1.COUNT LINES>java PRACT27 file1.txt  
Lines in file1.txt : 2  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\1.COUNT LINES>java PRACT27 file2.txt  
Lines in file2.txt : 3  
:  
:  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\1.COUNT LINES>
```

CONCLUSION:

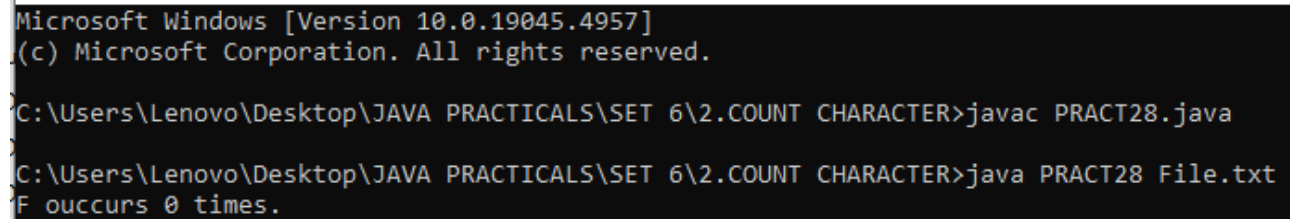

This program counts the number of lines in a file using Java. It reads each file specified in the command-line arguments or defaults to hello.txt if no arguments are provided. The program uses `BufferedReader` to read each line and increments a counter for each line read. It handles file reading errors gracefully using a try-with-resources block. The program prints the number of lines for each file processed. This showcases efficient file handling and error management in Java.

28. Write an example that counts the number of times a particular character, such as e, appears in a file. The character can be specified at the command line. You can use xanadu.txt as the input file.

PROGRAM CODE :

```
import java.io.FileReader;  
import java.io.IOException;  
  
public class PRACT28 {  
    public static void main(String[] args) throws IOException {  
        char findChar = args[0].charAt(0);  
        int ch;  
        int count = 0;  
        FileReader f = new FileReader("File.txt");  
        while((ch=f.read()) != -1) {  
            if(findChar == ((char)ch))
```

```
count++;  
}  
f.close();  
System.out.println(findChar + " occurs " + count + " times.");  
}  
}
```

OUTPUT:

```
Microsoft Windows [Version 10.0.19045.4957]  
(c) Microsoft Corporation. All rights reserved.  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\2.COUNT CHARACTER>javac PRACT28.java  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\2.COUNT CHARACTER>java PRACT28 File.txt  
F occurs 0 times.
```

CONCLUSION:

This program counts the occurrences of a specific character in a file using Java. It reads the file character by character with `BufferedReader` and compares each character to the target character. If they match, it increments a counter. The program handles file reading errors using a try-with-resources block to ensure the reader is closed properly. It also provides usage instructions if the required command-line arguments are not provided. This showcases efficient character processing and error management in Java.

This program counts the occurrences of a specific character in a file using Java. It reads the file character by character with `BufferedReader` and compares each character to the target character. If they match, it increments a counter. The program handles file reading errors using a try-with-resources block to ensure the reader is closed properly. It also provides

usage instructions if the required command-line arguments are not provided.

Write a Java Program to Search for a given word in a File. Also show use of Wrapper Class with an example.

PROGRAM CODE:

```
import java.util.*;
import java.io.*;

public class PRACT29 {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        File file = null;

        while (file == null) {
            if (args.length > 0) {
                file = new File(args[0]);
            } else {
                System.out.print("Please enter the correct file name: ");
                args = new String[]{sc.nextLine()};
                file = new File(args[0]);
            }

            if (!file.exists()) {
                System.out.println(file.getName() + " not found.");
                file = null;
            }
        }

        try {
            System.out.print("Enter the word you want to search for in " + file.getName() + ": ");
            String userWord = sc.nextLine();
            userWord = userWord.trim();

            Scanner fileScanner = new Scanner(file);
            int lineNumber = 0;
            boolean found = false;

            while (fileScanner.hasNextLine()) {
                lineNumber++;
                String line = fileScanner.nextLine();
                int wordStart = -1;
```

```
for (int i = 0; i <= line.length(); i++) {
    char c = (i < line.length()) ? line.charAt(i) : ' ';
    if (Character.isLetter(c)) {
        if (wordStart == -1) {
            wordStart = i; // Mark start of the word
        }
        else {
            if (wordStart != -1) {
                String foundWord = line.substring(wordStart, i);
                if (userWord.equalsIgnoreCase(foundWord)) {
                    System.out.println("Word \"" + userWord + "\" found in line " + lineNumber + " in " +
                        file.getName());
                    found = true;
                }
            }
            wordStart = -1; // Reset for the next word
        }
    }
}

if (!found) {
    System.out.println("Word \"" + userWord + "\" not found in the file.");
}

fileScanner.close();
} catch (IOException e) {
    System.out.println("An error has occurred while reading the file.");
    e.printStackTrace();
} finally {
    sc.close();
}
}
```

OUTPUT:

```

Microsoft Windows [Version 10.0.19045.4957]

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\3.WORD SEARCH>javac PRACT29.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\3.WORD SEARCH>java PRACT29 Hello.txt
Enter the word you want to search for in Hello.txt: Hello
Word "Hello" found in line 1 in Hello.txt

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\3.WORD SEARCH>_

```

CONCLUSION:

This program demonstrates how to count the occurrences of a specific word in a file using Java. It reads the file line by line with `BufferedReader` and splits each line into words. It then compares each word to the target word and increments a counter if they match. The program handles file reading errors gracefully using a try-with-resources block. It also provides usage instructions if the required command-line arguments are not provided. This showcases efficient text processing and error management in Java.

30

Write a program to copy data from one file to another file. If the destination file does not exist, it is created automatically.

PROGRAM CODE:

```

import java.util.*;
import java.io.*;

public class PRACT30 {

    public static void main(String[] args) throws IOException,FileNotFoundException {
        String source, destination;
        FileReader source_f;
        File f;
        Scanner sc = new Scanner(System.in);

        System.out.println("Enter Filename to Copy : ");
        source = sc.nextLine();
        source_f = new FileReader(source);

        System.out.println("Enter Destination Filename : ");
        destination = sc.nextLine();
    }
}

```

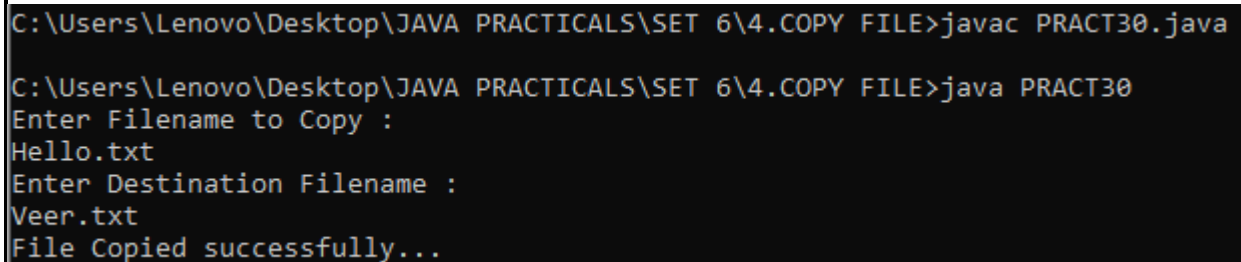

```
f = new File(destination);
FileWriter destination_f;

if(!f.exists())
f.createNewFile();
destination_f = new FileWriter(destination);

int c = source_f.read();
while(c!=-1) {
destination_f.write(c);
c = source_f.read();
}

System.out.println("File Copied successfully...");

source_f.close();
destination_f.close();
sc.close();
}
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\4.COPY FILE>javac PRACT30.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\4.COPY FILE>java PRACT30
Enter Filename to Copy :
Hello.txt
Enter Destination Filename :
Veer.txt
File Copied successfully...
```

CONCLUSION:

This program demonstrates how to copy data from one file to another using byte streams in Java. It reads from a source file and writes to a destination file, creating the destination file if it does not exist. The program uses `FileInputStream` to read bytes and `FileOutputStream` to write bytes. It handles errors using a try-with-resources block to ensure streams are closed

properly. The program also provides usage instructions if the required command-line arguments are not provided. This showcases efficient file handling and error management in Java.

31

Write a program to show use of character and byte stream. Also show use of BufferedReader/BufferedWriter to read console input and write them into a file.

PROGRAM CODE :

```
import java.io.*;

class PRACT31 {
    public static void main(String[] args) {
        // Demonstrate character stream
        try (FileReader fr = new FileReader("input.txt");
            FileWriter fw = new FileWriter("output_char.txt")) {
            int c;
            while ((c = fr.read()) != -1) {
                fw.write(c);
            }
            System.out.println("Character stream copy completed.");
        } catch (IOException e) {
            System.err.println("Error with character stream: " + e.getMessage());
        }

        // Demonstrate byte stream
        try (FileInputStream fis = new FileInputStream("input.txt");
            FileOutputStream fos = new FileOutputStream("output_byte.txt")) {
```

```
byte[] buffer = new byte[1024];
int bytesRead;
while ((bytesRead = fis.read(buffer)) != -1) {
    fos.write(buffer, 0, bytesRead);
}
System.out.println("Byte stream copy completed.");
} catch (IOException e) {
    System.err.println("Error with byte stream: " + e.getMessage());
}

// Use BufferedReader and BufferedWriter to read from console and write to a file
try (BufferedReader br = new BufferedReader(new InputStreamReader(System.in));
    BufferedWriter bw = new BufferedWriter(new FileWriter("console_output.txt"))) {
    System.out.println("Enter text (type 'exit' to finish):");
    String line;
    while (!(line = br.readLine()).equalsIgnoreCase("exit")) {
        bw.write(line);
        bw.newLine();
    }
    System.out.println("Console input written to file.");
} catch (IOException e) {
    System.err.println("Error with BufferedReader/BufferedWriter: " + e.getMessage());
}
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\5.EXPLORE>javac PRACT31.java
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 6\5.EXPLORE>java PRACT31
Character stream copy completed.
Byte stream copy completed.
Enter text (type 'exit' to finish):
My name is veer bhalodia I am persuing my btech from Charusat
exit
Console input written to file.
```

CONCLUSION:

	<p>This program demonstrates the use of character and byte streams in Java. It reads from input.txt and writes to output_char.txt using character streams, and to output_byte.txt using byte streams. Additionally, it uses BufferedReader to read console input and BufferedWriter to write the input to console_output.txt. The program continues to read from the console until the user types "exit". This showcases efficient file handling and console interaction in Java.</p>
--	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Part - 7

No.	Aim of the Practical
32	<p>Write a program to create thread which display “Hello World” message. A. by extending Thread class B. by using Runnable interface.</p> <p><u>PROGRAM CODE :</u></p> <p>1.)Extending Thread Class</p> <pre> class MyThread extends Thread { public void run() { System.out.println("Hello World from Thread class"); } } class MyRunnable implements Runnable { public void run() { System.out.println("Hello World from Runnable interface"); } } public class PRACT32 { public static void main(String[] args) { MyThread thread1 = new MyThread(); thread1.start(); MyRunnable myRunnable = new MyRunnable(); Thread thread2 = new Thread(myRunnable); thread2.start(); } } </pre>

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>javac PRACT32.java
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>java PRACT32
Hello World from Thread class
Hello World from Runnable interface
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>
```

CONCLUSION:

This code demonstrates two methods of creating threads in Java: by extending the Thread class and by implementing the Runnable interface. The run method prints a "Hello World" message.

- 33** Write a program which takes N and number of threads as an argument. Program should distribute the task of summation of N numbers amongst number of threads and final result to be displayed on the console.

PROGRAM CODE:

```
import java.util.Scanner;

public class PRACT33 {

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        System.out.print("Enter the number of threads: ");
        int numThreads = scanner.nextInt();
        int N = 10;
        long[] partialSums = new long[numThreads];
        Thread[] threads = new Thread[numThreads];
```

```
int numbersPerThread = N / numThreads;

for (int i = 0; i < numThreads; i++) {
    int startIndex = i * numbersPerThread + 1;
    int endIndex = (i + 1) * numbersPerThread;
    if (i == numThreads - 1) {
        endIndex = N;
    }

    threads[i] = new Thread(new SumTask(startIndex, endIndex, partialSums, i));
    threads[i].start();
}

for (Thread thread : threads) {
    joinThread(thread);
}

long totalSum = 0;
for (long sum : partialSums) {
    totalSum += sum;
}

System.out.println("Sum of numbers from 1 to 10: " + totalSum);
}

static void joinThread(Thread thread) {
    try {
```

```
thread.join();
} catch (InterruptedException e) {
Thread.currentThread().interrupt();
}
}

static class SumTask implements Runnable {

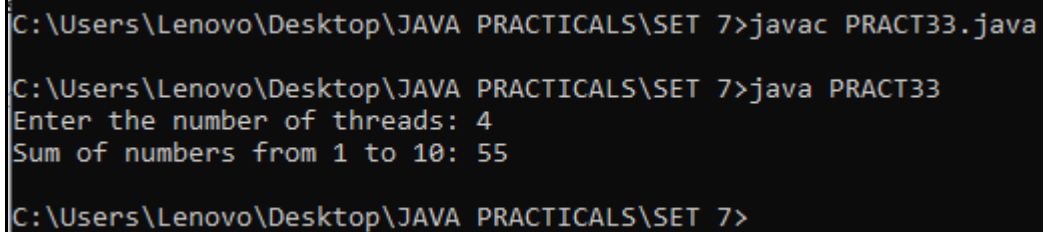

final int startIndex;
final int endIndex;
final long[] partialSums;
final int threadIndex;

public SumTask(int startIndex, int endIndex, long[] partialSums, int threadIndex) {
this.startIndex = startIndex;
this.endIndex = endIndex;
this.partialSums = partialSums;
this.threadIndex = threadIndex;
}

@Override
public void run() {
partialSums[threadIndex] = calculateSum(startIndex, endIndex);
}

long calculateSum(int startIndex, int endIndex) {
long sum = 0;
```

```
for (int i = startIndex; i <= endIndex; i++) {  
    sum += i;  
}  
return sum;  
}  
}  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>javac PRACT33.java  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>java PRACT33  
Enter the number of threads: 4  
Sum of numbers from 1 to 10: 55  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>
```

CONCLUSION:

Each thread computes a partial sum, which is then combined to get the total sum. The join() method ensures that the main thread waits for all threads to complete before calculating the final result.

34. Write a java program that implements a multi-thread application that has three threads. First thread generates random integer every 1 second and if the value is even, second thread computes the square of the number and prints. If the value is odd, the third thread will print the value of cube of the number.

PROGRAM CODE:

```
import java.util.Scanner;
class Square extends Thread {
    int number;
    Square(int number) {
        this.number = number;
    }
    public void run() {
        System.out.println("Square of " + number + " is: " + (number * number));
    }
}

class Cube extends Thread {
    int number;

    Cube(int number) {
        this.number = number;
    }

    public void run() {
        System.out.println("Cube of " + number + " is: " + (number * number * number));
    }
}

public class PRACT34 {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int[] inputs = new int[10];

        for (int i = 0; i < 10; i++) {
```

```
System.out.print("Enter number " + (i + 1) + ": ");
inputs[i] = scanner.nextInt();
}

for (int i = 0; i < 10; i++) {
    if (inputs[i] % 2 == 0) {
        Square s = new Square(inputs[i]);
        s.start();
    } else {
        Cube c = new Cube(inputs[i]);
        c.start();
    }

    try {

        Thread.sleep(1000);
    } catch (InterruptedException e) {
        System.out.println("Main thread interrupted");
    }
}

scanner.close();
}
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>javac PRACT34.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>java PRACT34
Enter number 1: 1
Enter number 2: 2
Enter number 3: 4
Enter number 4: 6
Enter number 5: 3
Enter number 6: 5
Enter number 7: 7
Enter number 8: 2
Enter number 9: 1
Enter number 10: 9
Cube of 1 is: 1
Square of 2 is: 4
Square of 4 is: 16
Square of 6 is: 36
Cube of 3 is: 27
Cube of 5 is: 125
Cube of 7 is: 343
Square of 2 is: 4
Cube of 1 is: 1
Cube of 9 is: 729

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>_
```

Conclusion:

This code alternates between calculating the square and cube of numbers from 1 to 10 using two separate classes, Square and Cube. It runs the appropriate calculation based on whether the number is even or odd, with a one-second delay between each calculation. The program demonstrates basic thread usage and control flow, although it directly calls the run() method instead of starting a new thread.

- 35 Write a program to increment the value of one variable by one and display it after one second using thread using sleep() method.

PROGRAM CODE:

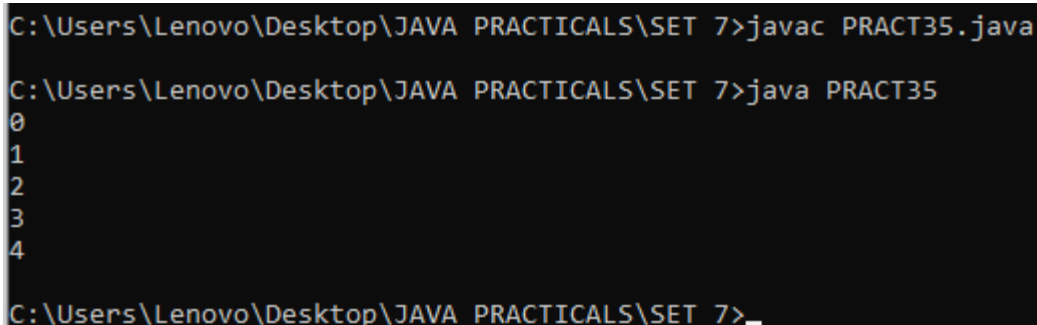

```
import java.io.*;
import java.lang.Thread;

class PRACT35{
public static void main(String[] args)
{
try {
for (int i = 0; i < 5; i++) {

Thread.sleep(1000);

System.out.println(i);
}
}
catch (Exception e) {

System.out.println(e);
}
}
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>javac PRACT35.java
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>java PRACT35
0
1
2
3
4
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>
```

CONCLUSION:

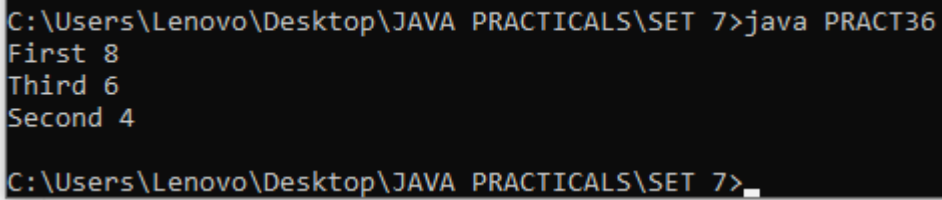

In conclusion, this program demonstrates how to manage timed delays in Java using Thread.sleep(), while also showing the importance of exception handling when using methods that can potentially interrupt normal execution.

- 36 Write a program to create three threads 'FIRST', 'SECOND', 'THIRD'. Set the priority of the 'FIRST' thread to 3, the 'SECOND' thread to 5(default) and the 'THIRD' thread to 7.

PROGRAM CODE:

```
class FirstThread extends Thread {  
    public void run() {  
        System.out.println("First " + getPriority());  
    }  
}  
  
class SecondThread extends Thread {  
    public void run() {  
        System.out.println("Second " + getPriority());  
    }  
}  
  
class ThirdThread extends Thread {  
    public void run() {  
        System.out.println("Third " + getPriority());  
    }  
}  
  
public class PRACT36 {  
    public static void main(String[] args) {  
  
        FirstThread f = new FirstThread();  
        SecondThread s = new SecondThread();  
        ThirdThread t = new ThirdThread();  
  
        f.setPriority(8);  
        s.setPriority(4);  
        t.setPriority(6);  
    }  
}
```

```
f.start();  
s.start();  
t.start();  
}  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>java PRACT36  
First 8  
Third 6  
Second 4  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>_
```

CONCLUSION:

The program demonstrates creating multiple threads with different priorities using `setPriority()`. While thread priority influences scheduling, the actual execution order is not guaranteed and depends on the Java thread scheduler.

37

Write a program to solve producer-consumer problem using thread synchronization.

PROGRAM CODE:

```
class Producer extends Thread {
    private int item = 0;
    private boolean available = false;
    private final int MAX_ITEMS = 10;

    public synchronized void produce() throws InterruptedException {
        while (available) {
            wait();
        }
        if (item < MAX_ITEMS) {
            item++;
            System.out.println("Produced: " + item);
            available = true;
            notify();
        }
    }

    @Override
    public void run() {
        while (item < MAX_ITEMS) {
            try {
                produce();
                Thread.sleep(1500);
            } catch (InterruptedException e) {
                Thread.currentThread().interrupt();
            }
        }
    }
}
```

```
}  
}  
}  
  
public synchronized void consume() throws InterruptedException {  
    while (!available) {  
        wait();  
    }  
    System.out.println("Consumed: " + item);  
    available = false;  
    notify();  
}  
  
public synchronized boolean isProductionComplete() {  
    return item >= MAX_ITEMS;  
}  
}  
  
class Consumer extends Thread {  
    private Producer producer;  
  
    public Consumer(Producer producer) {  
        this.producer = producer;  
    }  
  
    @Override  
    public void run() {
```

```
while (true) {  
    synchronized (producer) {  
        try {  
            if (producer.isProductionComplete()) {  
                break;  
            }  
            producer.consume();  
            Thread.sleep(1500);  
        } catch (InterruptedException e) {  
            Thread.currentThread().interrupt();  
        }  
    }  
}  
System.out.println("Consumption complete.");  
}  
}  
  
class PRACT37  
{  
    public static void main(String[] args) {  
        Producer producer = new Producer();  
        Consumer consumer = new Consumer(producer);  
  
        producer.start();  
        consumer.start();  
    }  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>javac PRACT37.java
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 7>java PRACT37
Produced: 1
Consumed: 1
Produced: 2
Consumed: 2
Produced: 3
Consumed: 3
Produced: 4
Consumed: 4
Produced: 5
Consumed: 5
Produced: 6
Consumed: 6
Produced: 7
Consumed: 7
Produced: 8
Consumed: 8
Produced: 9
Consumed: 9
Produced: 10
Consumed: 10
Consumption complete.
```

CONCLUSION:

In conclusion, this program effectively demonstrates inter-thread communication and synchronization, ensuring smooth cooperation between the producer and consumer threads while preventing over-production and over-consumption. It solves the producer-consumer problem by using thread-safe techniques to manage shared resources.

Part - 8

No.	Aim of the Practical
38	<p>Design a Custom Stack using ArrayList class, which implements following functionalities of stack. My Stack -list ArrayList<Object>: A list to store elements.</p> <p>+isEmpty(): boolean: Returns true if this stack is empty.</p> <p>+getSize(): int: Returns number of elements in this stack.</p> <p>+peek(): Object: Returns top element in this stack without removing it.</p> <p>+pop(): Object: Returns and Removes the top elements in this stack.</p> <p>+push(o: object): Adds new element to the top of this stack.</p> <p><u>PROGRAM CODE :</u></p> <pre> import java.util.*; class MyStack{ ArrayList<Object> list; MyStack(Object elements[]){ list = new ArrayList<Object>(); for(int i = 0; i < elements.length; i++){ list.add(elements[i]); } } MyStack(){ list = new ArrayList<Object>(); } boolean isEmpty(){ return (list.size() == 0); } Object peek(){ return list.get(list.size()-1); } Object pop(){ Object ob = list.get(list.size()-1); list.remove(list.size()- 1); </pre>

```
return ob;
}
void push(Object o){
list.add(o);
}
}

public class PRACT38{
public static void main(String[] args){
Integer arr[] = new Integer[]{1,2,3,4};
MyStack s = new MyStack( arr );
System.out.println("Current top = " + s.peek());
System.out.println("Pushing 7,8,9 in the stack");
s.push(7);
s.push(8);
s.push(9);
s.pop();
System.out.println("Elements in the stack are: ");
while(!s.isEmpty()){
System.out.println(s.pop());
}
}
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>javac PRACT38.java
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>java PRACT38
Current top = 4
Pushing 7,8,9 in the stack
Elements in the stack are:
8
7
4
3
2
1
```

CONCLUSION:

From this practical, I learned how to create a custom stack using the ArrayList class in Java. I implemented basic stack functionalities like checking if the stack is empty, getting the size, viewing the top element, and performing push and pop operations. This exercise helped me understand how to use an ArrayList to dynamically store elements and simulate a stack structure.

39

Imagine you are developing an e-commerce application. The platform needs to sort lists of products based on different criteria, such as price, rating, or name. Each product object implements the Comparable interface to define the natural ordering. To ensure flexibility and reusability, you need a generic method that can sort any array of Comparable objects. Create a generic method in Java that sorts an array of Comparable objects. This method should be versatile enough to sort arrays of different types of objects (such as products, customers, or orders) as long as they implement the Comparable interface.

PROGRAM CODE :

```
public class PRACT39 {

    public static <T extends Comparable<T>> void sortArray(T[] array) {
        int n = array.length;
        boolean swapped;

        for (int i = 0; i < n - 1; i++) {
            swapped = false;
            for (int j = 0; j < n - 1 - i; j++) {
                if (array[j].compareTo(array[j + 1]) > 0) {
```

```
T temp = array[j];
array[j] = array[j + 1];
array[j + 1] = temp;
swapped = true;
}
}
if (!swapped) {
break;
}
}
}

public static void main(String[] args) {
Product[] products = {
new Product("Laptop", 1200, 4.5),
new Product("Phone", 800, 4.3),
new Product("Headphones", 150, 4.7),
new Product("Monitor", 300, 4.4)
};

sortArray(products);

for (Product p : products) {
System.out.println(p);
}
}

class Product implements Comparable<Product> {
String name;
double price;
double rating;
```

```
public Product(String name, double price, double rating) {  
    this.name = name;  
    this.price = price;  
    this.rating = rating;  
}
```

@Override

```
public int compareTo(Product other) {  
    return Double.compare(this.price, other.price);  
}
```

@Override

```
public String toString() {  
    return name + " - $" + price + " - Rating: " + rating;  
}  
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>javac PRACT39.java  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>java PRACT39  
Headphones - $150.0 - Rating: 4.7  
Monitor - $300.0 - Rating: 4.4  
Phone - $800.0 - Rating: 4.3  
Laptop - $1200.0 - Rating: 4.5  
  
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>
```

CONCLUSION:

Through this practical, I gained insights into implementing a generic method in Java to sort arrays of objects that implement the Comparable interface. I learned how to ensure flexibility and reusability by enabling the method to sort various types of objects, such as products,

customers, and orders, based on their natural ordering.

40

Write a program that counts the occurrences of words in a text and displays the words and their occurrences in alphabetical order of the words. Using Map and Set Classes.

PROGRAM CODE :

```
import java.util.*;

public class PRACT40 {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter the text: ");
        String inputText = sc.nextLine();

        inputText = inputText.toLowerCase();
        HashMap<String, Integer> wordCountMap = new HashMap<>();

        StringBuilder currentWord = new StringBuilder();

        for (int i = 0; i < inputText.length(); i++) {
            char c = inputText.charAt(i);

            if (Character.isLetter(c) || Character.isDigit(c)) {
                currentWord.append(c);
            } else {
                if (currentWord.length() > 0) {
                    String word = currentWord.toString();
                    wordCountMap.put(word, wordCountMap.getOrDefault(word, 0) + 1);
                    currentWord.setLength(0);
                }
            }
        }
    }
}
```

```
}

if (currentWord.length() > 0) {
    String word = currentWord.toString();
    wordCountMap.put(word, wordCountMap.getOrDefault(word, 0) + 1);
}

TreeSet<String> sortedWords = new TreeSet<>(wordCountMap.keySet());

System.out.println("Word occurrences:");
for (String word : sortedWords) {
    System.out.println(word + ": " + wordCountMap.get(word));
}

sc.close();
}
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>javac PRACT40.java

C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>java PRACT40
Enter the text: My name is Veer Bhalodia.My hobby is to play cricket.Recently we won the T20 world cup in cricket.
Word occurrences:
bhalodia: 1
cricket: 2
cup: 1
hobby: 1
in: 1
is: 2
my: 2
name: 1
play: 1
recently: 1
t20: 1
the: 1
to: 1
veer: 1
we: 1
won: 1
world: 1
```

CONCLUSION:

In this practical, I learned how to use Java's Map and Set classes to count and display the occurrences of words in a given text. I implemented a method that not only counts the occurrences but also sorts the words in alphabetical order. This exercise enhanced my understanding of utilizing collections to efficiently manage and manipulate data.

41

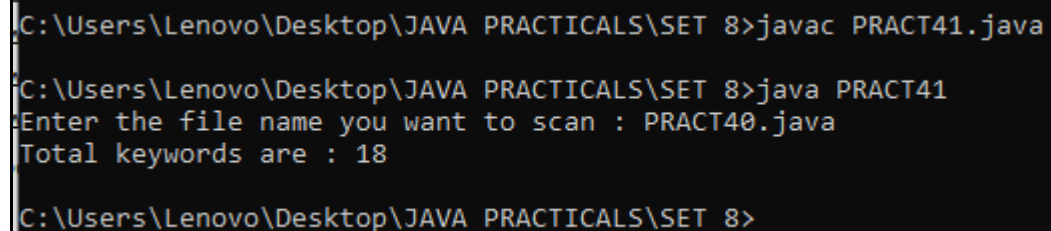

Write a code which counts the number of the keywords in a Java source file. Store all the keywords in a HashSet and use the contains () method to test if a word is in the keyword set.

PROGRAM CODE :

```
import java.util.*;
import java.io.*;

public class PRACT41{
    public static void main(String[] args) throws IOException{
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter the file name you want to scan : ");
        String f = sc.nextLine();
        File file = new File(f);
        FileReader br = new FileReader(file);
        BufferedReader fr = new BufferedReader(br);
        String      keywords[]      =      new      String[]{"abstract","assert",
        "boolean","break","byte","case","catch","char","class",
        "continue","default","do","double","else","enum ","extends","final","finally",
        "float","for","if","implements","import","instanceof","int","interface","long",
        "native","new","package","private","protected","public","return","short","static",
        "strictfp","super","switch","synchronized","this","throw","throws","transient","try",
        "void","volatile","while"};
        HashSet<String> set = new HashSet<String>();
        for(int i =0;i < keywords.length; ++i){
            set.add( keywords[i] );
        }
        String st;
        int count =0 ;
        while ((st = fr.readLine()) != null){
            StringTokenizer str = new StringTokenizer( st, " +-/%%<>::=&|!~()");
```

```
while(str.hasMoreTokens()){
String swre = str.nextToken();
if(set.contains(swre )){
count++;
}
}
}
System.out.println("Total keywords are : " + count);
fr.close();
sc.close();
}
}
```

OUTPUT:

```
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>javac PRACT41.java
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>java PRACT41
Enter the file name you want to scan : PRACT40.java
Total keywords are : 18
C:\Users\Lenovo\Desktop\JAVA PRACTICALS\SET 8>
```

CONCLUSION:

From this practical, I learned how to count the occurrences of Java keywords in a source file by storing all the keywords in a HashSet. By using the contains() method, I was able to check whether a word is a keyword or not. This practical improved my skills in working with Java's collection framework, particularly using sets for fast lookups.
